

# LASER

## LASER POA TRIVIALIS

- **TOLERATES CLOSE MOWING**
- **IDEAL FOR DAMP OR SHADY AREAS**
- **SLOW GROWTH RATE**
- **FINE-LEAF TEXTURE**
- **EXCELLENT WINTER HARDINESS**
- **ESTABLISHES WELL AT LOW SOIL TEMPERATURE**
- **EARLY SPRING GREEN-UP**

## THE MOST ACCURATE OVERSEEDING OPTION

Laser Poa Trivialis tolerates an extremely low height of cut due to its prostrate growth habit. This leads to fewer clippings, a neater appearance and less work for you. Used alone, with other Poa Trivialis varieties, or blended with perennial ryegrass and/or Chewings fescue. Laser germinates quickly and can be cut immediately after overseeding, making it a natural choice for winter overseeding in the southern U.S. Its combination of medium dark color, improved turf quality, density, fine leaf texture and cool weather color retention make it an ideal choice for overseeding greens and tees. Because Laser is exceptionally cold tolerant and retains its color in cool weather, it is used in the northern U.S. in areas subject to shady, damp and/or wet conditions. Whatever your growing situation, the darker green color of Laser will stand out on the course.
