2020 NTEP Data, All Mean Data Used. Turfgrass Quality and Other Ratings 1-9; 9=Best

### SEEDING

Tall Fescue prefers warmer soil for germination, typically 55°F to 58°F. In the Transition zone this means early spring and early fall. Further north, late spring and late summer is preferred. Avenger 3 should be sown at a rate of 6-9 lbs per 1000 sq ft (275-400 lbs per acre). Maximum density is achieved by planting with a slicer/seeder or following aerification, and with the application of a starter fertilizer. Overseed existing tall fescue at a rate of 225-300 lbs per acre.

### MAINTENANCE

Avenger 3's natural dark color, density, and pest resistance minimize the need for extensive maintenance. Generally 2-3 lbs of nitrogen as part of a balanced fertilizer applied annually is all that's required. Cutting heights should range between 2-3". Under controlled conditions heights down to 1" can be maintained.
