

Stealth (PPG-TF 238) is the newest addition to the family line in the MVS Tall Fescue program! It's parents were selected for quick, aggressive establishment, recovery from summer heat and disease, and the ability to be low-mowed. Stealth has fine texture and scored high in the NTEP for turf quality in the Northeast and Transition climates. Sneak past the competition with Stealth tall fescue!

2019-2020 NTEP Data, All Mean Data Used. Turfgrass Quality and Other Ratings 1-9; 9=Best

SEEDING

Tall fescue prefers warmer soil for germination, typically 55°F to 58°F. In the Transition zone this means early spring and early fall. Further north, late spring and late summer is preferred. Stealth should be sown at a rate of 6-9 lbs per 1000 sq ft (275-400 lbs per acre). Maximum density is achieved by planting with a slicer/seeder or following aerification, and with the application of a starter fertilizer. Overseed existing tall fescue at a rate of 225-300 lbs per acre.

MAINTENANCE

Stealth's natural dark color, density, and pest resistance minimize the need for extensive maintenance. Generally 2-3 lbs of nitrogen as part of a balanced fertilizer applied annually is all that's required. Cutting heights should range between 2-3". Under controlled conditions heights down to 1" can be maintained.
